

Description

Making a Lighting for my aura effect so I can display it later on with my diorama

How to use it and what I needed

When you click on Circle “A” or “B” it turns on an LED and plays an audio

5 Leds or more

Aura effect part (can be made in 3d printer or bought long as its bit clear)

Wires

Soldering kit or a way to solder the LEDs to the wires long enough

The first part was basically getting all the LEDs and testing the brightness on it on my effect piece

Second WIP I got brighter LEDs and had a little diorama for my figure and testing on where and what size of box I needed

Third WIP (got random LEDs and got them to stay on after clicking them audio works fine as well)
